- b) To amplify weak signals
- c) To rectify AC signals
- d) To act as a switch only

Answer: b) To amplify weak signals

Explanation: The main purpose of a transistor amplifier is to increase the amplitude of a weak input signal, making it suitable for further processing or driving loads. It does not convert AC to DC (rectification) nor solely act as a switch, although transistors can serve switching functions.

Question 2: In a common emitter amplifier, the voltage gain is approximately proportional to:
