1. Lens

The lens is perhaps the most recognizable part of a camera, responsible for focusing light onto the image sensor. It comprises multiple glass elements arranged precisely to control focus, zoom, and aperture.

- Functions:
- Focuses incoming light onto the image sensor for sharp images.
- Adjusts for zooming (changing focal length) to frame subjects at different distances.

- Regulates the amount of light reaching the sensor via aperture control.
- Types:
 - Prime lenses (fixed focal length)
 - Zoom lenses (variable focal length)
 - Specialty lenses (macro, wide-angle, telephoto)

Understanding the lens's specifications, such as focal length and aperture size, helps determine the camera's capability in various shooting conditions.

2. Image Sensor

The image sensor is the digital equivalent of traditional photographic film. It converts incoming light into electrical signals that form the digital image.

- Types:
 - CCD (Charge-Coupled Device)
 - CMOS (Complementary Metal-Oxide-Semiconductor) - more common in modern cameras
- Key attributes:
 - Megapixel count: influences resolution
 - Size: larger sensors typically offer better image quality, especially in low light
- Functionality:
 - Converts photons into electronic signals
 - Works in tandem with the lens to capture the scene
