Gills and Operculum

The gills are the respiratory organs of the tilapia, enabling gas exchange with water.

- **Gills:** Structures with filaments rich in blood vessels, facilitating oxygen intake and carbon dioxide release.
- **Operculum (Gill Cover):** A bony plate that covers and protects the gills. It also helps in the movement of water over the gills during respiration.

Body Structure

The body of the tilapia is elongated and laterally compressed, aiding in swift movement.

- **Swim Bladder:** An internal gas-filled organ that helps the fish maintain buoyancy. It allows tilapia to stay at desired depths without expending much energy.
- **Spinal Column:** The backbone runs along the length of the body, providing structural support.

Fins and Their Functions

Fins are crucial for movement, stability, and maneuvering.

- **Pectoral Fins:** Located on each side, just behind the gills, these fins help in steering and balancing.

Located on the sides of the head, tilapia have good visual acuity, which is crucial for detecting predators, prey, and mates. Eye size and position can also influence feeding behavior.

Dorsal Fin

Consists of spines and soft rays, providing stability during swimming and aiding in sudden directional changes.

Pectoral Fins

Located just behind the gills, these fins help in maneuvering and maintaining balance.

Pelvic Fins

Situated ventrally (on the underside), they assist in stabilization and precise movements.

Anal Fin

Positioned near the tail, it contributes to stabilization during swimming.

Caudal Fin

The tail fin provides propulsion. The shape (forked, rounded) can influence swimming speed and maneuverability.

Lateral Line

A sensory system that detects vibrations and water movements, enabling the fish to respond to environmental stimuli, prey, or predators.

Scales

Tilapia typically have cycloid scales, smooth and overlapping, providing protection without hindering movement.

Internal Anatomy in Detail

Gills

Located behind the operculum, gills are rich in blood vessels, facilitating gas exchange. Water drawn in through the mouth passes over the gills, where oxygen is absorbed and carbon dioxide expelled.
