Sample Managerial Economics Final Exam Questions and Solutions

Below is a curated list of commonly encountered questions along with detailed solutions to help you prepare effectively.

Question 1: Demand Elasticity Calculation

Question:

A firm observes that when the price of its product decreases from \$10 to \$8, the quantity demanded increases from 100 units to 150 units. Calculate the price elasticity of demand and interpret the result.

Solution:

- Identify the initial and final values:
- $P_1 = \$10$, $P_2 = \$8$
- $Q_1 = 100$ units, $Q_2 = 150$ units
- Calculate the percentage change in price:

\[

$$\Delta P = \frac{P_2 - P_1}{P_1} \times 100 = \frac{8 - 10}{10} \times 100 = -20\%$$

\]

- Calculate the percentage change in quantity demanded:

\[

$$\Delta Q = \frac{Q_2 - Q_1}{Q_1} \times 100 = \frac{150 - 100}{100} \times 100 = 50\%$$

\\

- Calculate price elasticity of demand (PED):

\\

$$\text{PED} = \frac{\Delta Q}{\Delta P} = \frac{50\%}{-20\%} = -2.5$$

\\

Interpretation:

Since the absolute value of PED is greater than 1, demand is elastic. A 1% decrease in price results in approximately a 2.5% increase in quantity demanded, indicating that consumers are relatively responsive to price changes.

Question 2: Cost Curves and Profit Maximization

Question:

A firm's total cost (TC) function is given by:

\\

$$TC = 100 + 20Q + 5Q^2$$

\\

where Q is the quantity produced. The firm's revenue function is $(TR = P \times Q)$, and the market price (P) is \$50. Determine the profit-maximizing output level and the maximum profit.

Solution:

- Calculate Total Revenue (TR):

\\

$$TR = P \times Q = 50Q$$

\\

- Find the total cost (TC):

\\

$$TC = 100 + 20Q + 5Q^2$$

\\

- Determine profit function:

\\

$$\pi(Q) = TR - TC = 50Q - (100 + 20Q + 5Q^2)$$

\\

\\

$$\pi(Q) = 50Q - 100 - 20Q - 5Q^2 = (30Q) - 100 - 5Q^2$$

\\

- Find the critical point for profit maximization:

\\

$$\frac{d\pi}{dQ} = 30 - 10Q = 0$$

\\

\\

$$Q = \frac{30}{10} = 3$$

\]

- Verify that this is a maximum:

\[

$$\frac{d^2\pi}{dQ^2} = -10$$

\]

Since the second derivative is negative, $Q = 3$ yields a maximum.

- Calculate maximum profit:

\[

$$\pi(3) = 30(3) - 100 - 5(3)^2 = 90 - 100 - 45 = -55$$

\]

Note: The profit is negative, indicating the firm incurs a loss at this output level. However, based on the profit function, $Q = 3$ is the profit-maximizing output. The firm may need to reconsider pricing or cost structure.

Question 3: Monopoly Pricing and Output Decision

Question:

A monopolist faces the demand function:

\[

$$Q = 120 - 2P$$

\]

and has a total cost function:

\[

$$TC = 200 + 10Q$$

\]

Determine the profit-maximizing price and quantity, along with the profit.

Solution:

- Express price in terms of quantity:

\[

$$P = \frac{120 - Q}{2}$$

\]

- Calculate total revenue:

\[

$$TR = P \times Q = \frac{120 - Q}{2} \times Q = \frac{120Q - Q^2}{2}$$

\]

\[

$$TR = 60Q - \frac{Q^2}{2}$$

\]

- Profit function:

\[

$$\pi(Q) = TR - TC = 60Q - \frac{Q^2}{2} - (200 + 10Q)$$

\]

\[

$$\pi(Q) = 60Q - \frac{Q^2}{2} - 200 - 10Q = (50Q) - \frac{Q^2}{2} - 200$$

\]

- Maximize profit:

\[

$$\frac{d\pi}{dQ} = 50 - Q = 0 \Rightarrow Q = 50$$

\]

- Calculate the corresponding price:

\[

$$P = \frac{120 - 50}{2} = \frac{70}{2} = 35$$

\]

- Calculate maximum profit:

\[

$$\pi(50) = 50 \times 50 - \frac{(50)^2}{2} - 200 = 2500 - 1250 - 200 = 1050$$

\]

Result:

The monopolist should produce 50 units and set the price at \$35 to maximize profit, earning a total profit of \$1050.

Detailed Solutions to Typical Final Exam Questions

Question 1: Explain Price Elasticity of Demand and Its Managerial Significance

Question: What is price elasticity of demand? How does it influence managerial pricing decisions?

Solution:

Definition:

Price elasticity of demand (PED) measures the responsiveness of the quantity demanded of a good to a change in its price. It is calculated as:

$$\text{PED} = \frac{\% \text{ change in quantity demanded}}{\% \text{ change in price}}$$

Interpretation:

- If $\text{PED} > 1$: Demand is elastic (sensitive to price changes).
- If $\text{PED} < 1$: Demand is inelastic.
- If $\text{PED} = 1$: Demand is unit elastic.

Managerial Implications:

- For products with elastic demand, raising prices may reduce total revenue, so firms should consider lowering prices to boost demand.
- For inelastic products, firms can increase prices without significantly reducing quantity demanded, thus increasing revenue.
- Understanding elasticity aids in designing effective pricing strategies, promotions, and product positioning.

Visual Aid:

A demand curve illustrating elastic and inelastic regions can help visualize how changes in price affect quantity demanded.

Question 2: Calculating and Interpreting Price Elasticity of Demand

Question:

Given the data: When the price of a product decreases from \$50 to \$45, the quantity demanded increases from 200 units to 250 units. Calculate the price elasticity of demand and interpret the result.

Solution:

- Calculate percentage change in price:

$$\Delta P = \frac{45 - 50}{50} \times 100 = -10\%$$

- Calculate percentage change in quantity demanded:

$$\Delta Q = \frac{250 - 200}{200} \times 100 = 25\%$$

- Calculate PED using the midpoint formula:

$$\text{PED} = \frac{\Delta Q}{\Delta P} = \frac{25}{-10} = -2.5$$

Interpretation:

Absolute value of PED is 2.5, indicating elastic demand.

Managerial insight:

A 10% decrease in price leads to a 25% increase in quantity demanded, suggesting that lowering prices could significantly increase total revenue.

Question 3: Cost Analysis and Break-Even Point Calculation

Question:

A firm faces the following cost structure: Fixed costs = \$50,000; Variable cost per unit = \$20. The selling price per unit is \$50. How many units must the firm sell to break even?

Solution:

- Determine contribution margin per unit:

$$\text{Contribution Margin} = \text{Price} - \text{Variable Cost} = 50 - 20 = \$30$$

- Calculate break-even point:

$$\text{Break-even units} = \frac{\text{Fixed Costs}}{\text{Contribution Margin per unit}} =$$

$$\frac{50,000}{30} \approx 1667 \text{ units}$$

Managerial Takeaway:

The firm must sell approximately 1,667 units to cover all costs. Understanding this helps in setting sales targets and pricing strategies.

Question 4: Market Structure and Pricing Strategy in Monopoly

Question:

In a monopolistic market, how should the firm determine its profit-maximizing price and output level?

Solution:

Step 1: Understand the Demand Curve

- The monopolist faces the market demand curve, which is downward sloping.

Step 2: Find the Marginal Revenue (MR) and Marginal Cost (MC)

- The profit-maximizing output is where $MR = MC$.

Step 3: Determine the Optimal Price

- Once the profit-maximizing output is identified, use the demand curve to find the corresponding price.

Step 4: Strategic Considerations

- The monopolist can set a higher price and lower output compared to perfect competition to maximize profits.
- Price discrimination opportunities can enhance profits further if feasible.

Example:

Suppose the demand function is $(Q = 100 - 2P)$, and the MC is \$20.

- Derive MR from the demand: $(P = 50 - 0.5Q)$.
- Total revenue $(TR = P \times Q = (50 - 0.5Q)Q = 50Q - 0.5Q^2)$.
- MR = derivative of TR: $(MR = 50 - Q)$.
- Set MR = MC: $(50 - Q = 20 \Rightarrow Q = 30)$.
- Find price: $(P = 50 - 0.5 \times 30 = 35)$.

Conclusion:

The firm should produce 30 units and charge \$35 per unit.

His academic career was primarily associated with Columbia University, where he sought to bridge the gap between economic theory and business practice. Dean's approach emphasized analytical rigor, clarity, and applicability, making his work accessible to both scholars and practicing managers.

Major Publications and Their Significance

Dean authored several influential texts, with his most notable being *Managerial Economics* (first published in 1951). This book became a cornerstone in the field, widely adopted in business schools worldwide. It offered a systematic framework for understanding economic concepts in managerial contexts, emphasizing decision-making processes and quantitative analysis.

Core Concepts in Joel Dean's Approach to Managerial Economics

- The Emphasis on Decision-Making Under Uncertainty

Dean believed that managers operate in environments fraught with uncertainty. His framework advocates for analyzing risks, employing probabilistic models, and using economic reasoning to make optimal decisions despite incomplete information.

- Cost-Volume-Profit Analysis

A significant contribution from Dean is his clear exposition of cost-volume-profit (CVP) analysis, which helps managers understand how changes in costs, volume, and prices affect profitability. He detailed how to derive breakeven points and margin of safety, tools crucial for strategic planning.

- Marginal Analysis and Optimization

Dean championed the principle of marginalism—analyzing incremental changes—to guide decisions such as pricing, output levels, and investment. His teachings stress that managers should compare marginal benefits with marginal costs to achieve optimal outcomes.

- Price and Output Determination

In his writings, Dean provided frameworks for understanding how firms determine prices and output levels in different market structures. He explored monopoly, oligopoly, and perfect competition, emphasizing strategic considerations like product differentiation and entry barriers.

- The Role of Market Structure and Competition

Dean underscored the importance of understanding market dynamics. His analyses demonstrated how market structure influences managerial decisions, with a focus on strategic behavior, barriers to entry, and competitive forces.

Methodological Innovations and Pedagogical Approach

Quantitative Techniques

Dean was an advocate of rigorous quantitative analysis, integrating algebra, calculus, and statistical methods into managerial decision-making. His texts often included mathematical models to illustrate economic principles, fostering a more analytical mindset among students and practitioners.

Simplification of Complex Concepts

Despite his emphasis on mathematical rigor, Dean was committed to making complex ideas accessible. His writing style combined clarity with depth, enabling readers to grasp intricate concepts without sacrificing analytical precision.
