Common Questions and Answers from Pearson DNA and RNA Workbooks

Q1: What is the basic structure of DNA?

A: DNA is a double helix consisting of two strands of nucleotides. Each nucleotide contains a sugar (deoxyribose), a phosphate group, and a nitrogenous base (Adenine, Thymine, Cytosine, Guanine).

The strands are held together by hydrogen bonds between complementary bases (A pairs with T, G pairs with C).

Q2: How does RNA differ from DNA?

A: RNA differs from DNA in several ways:

- RNA contains ribose sugar instead of deoxyribose.
- RNA is usually single-stranded, whereas DNA is double-stranded.
- RNA has Uracil (U) instead of Thymine (T).
- RNA plays a role in protein synthesis, while DNA primarily stores genetic information.

Q3: Describe the process of DNA replication.

A: DNA replication is a semi-conservative process where each original strand serves as a template for a new complementary strand. The process involves:

- Initiation at specific origins of replication.
- Unwinding the DNA helix by helicase.
- Complementary base pairing facilitated by DNA polymerase.
- Formation of two identical DNA molecules, each with one original and one new strand.

Q4: What is transcription, and why is it important?

A: Transcription is the process of synthesizing RNA from a DNA template. It is essential because it converts genetic information stored in DNA into a messenger RNA (mRNA) molecule, which then guides protein synthesis during translation.

Q5: Explain the roles of different types of RNA in protein synthesis.

- **mRNA (Messenger RNA):** Carries genetic information from DNA to the ribosome.
- **tRNA (Transfer RNA):** Brings amino acids to the ribosome during translation.
- **rRNA (Ribosomal RNA):** Forms the core of the ribosome's structure and catalyzes protein synthesis.

Q6: What are mutations, and how do they affect genetic information?

A: Mutations are changes in the DNA sequence. They can be:

- Point mutations (single nucleotide change)
- Insertions or deletions (adding or removing nucleotides)

Mutations can lead to altered proteins, which may cause genetic disorders or beneficial traits, depending on their nature and location.
