Sample Solutions for Common Financial Accounting Problems

Below are illustrative solutions to typical problems faced in Module 9:

Problem 1: Analyzing a Company's Liquidity

Scenario:

A company's balance sheet shows current assets of \$500,000 and current liabilities of \$250,000.

Solution:

Calculate the current ratio:

$$\text{Current Ratio} = \text{Current Assets} / \text{Current Liabilities} = \$500,000 / \$250,000 = 2.0$$

Interpretation:

A current ratio of 2.0 indicates good short-term liquidity, suggesting the company can comfortably meet its short-term obligations.

Problem 2: Choosing Inventory Valuation Method

Scenario:

A company with rising inventory costs needs to decide between FIFO and LIFO.

Solution:

- FIFO (First-In, First-Out) results in lower cost of goods sold and higher net income during inflation, but higher taxes.
- LIFO (Last-In, First-Out) aligns with current costs, reducing taxable income and income taxes but may understate inventory value.

Strategic Advice:

Select FIFO if the focus is on showing higher profits; choose LIFO for tax advantages during inflation periods.

Problem 3: Recording Depreciation

Scenario:

A machine costing \$100,000 with an estimated useful life of 10 years and salvage value of \$10,000.

Solution:

Straight-line depreciation per year:

$$(\text{Cost} - \text{Salvage Value}) / \text{Useful Life} = (\$100,000 - \$10,000) / 10 = \$9,000$$

Application:

Record \$9,000 as depreciation expense annually for 10 years, reducing the book value of the asset accordingly.
