Understanding Time Series Econometrics

What Is Time Series Econometrics?

Time series econometrics involves the application of statistical methods to data points collected sequentially over time. Unlike cross-sectional data, which captures a snapshot at a single point, time series data reflects dynamics, trends, and patterns that evolve. This field aims to:

- Identify underlying structures in economic data
- Model and forecast future values
- Test economic theories and hypotheses
- Assess the impact of policy interventions over time

Key Concepts in Time Series Econometrics

Understanding the foundational concepts is crucial for effective modeling:

- **Stationarity:** A stationary time series has constant mean, variance, and autocorrelation over time. Many models assume stationarity for valid inference.
- **Autocorrelation:** The correlation of a time series with its past values. Detecting autocorrelation helps in model selection.
- **Cointegration:** When non-stationary series are linked by a long-term equilibrium relationship, cointegration models can capture this connection.
- **Model Types:** Common models include AR (AutoRegressive), MA (Moving Average), ARMA, ARIMA, and GARCH models for volatility clustering.
