Key Concepts and Answers from Mathswatch Probability Clip 90

In this section, we delve into the main concepts covered in the clip, providing answers to typical questions and explaining the reasoning behind them.

1. Calculating Basic Probabilities

One of the fundamental skills in probability is calculating the likelihood of a specific event occurring. The probability of an event is expressed as a number between 0 and 1, or as a percentage between 0% and 100%. The basic formula is:

$$P(\text{event}) = (\text{Number of favorable outcomes}) / (\text{Total number of outcomes})$$

Sample question: If a bag contains 3 red, 2 blue, and 5 green balls, what is the probability of randomly selecting a red ball?

Answer:

- Total balls = $3 + 2 + 5 = 10$
- Favorable outcomes (red balls) = 3
- Probability = $3/10 = 0.3$ or 30%

2. Complementary Events

Complementary events are two outcomes that cover all possibilities, where the sum of their probabilities equals 1.

$$P(A) + P(A') = 1$$

Where $P(A)$ is the probability of event A, and $P(A')$ is the probability of the complement of A (A not happening).

Sample question: What is the probability of not drawing a green ball from the previous example?

Answer:

- Probability of drawing a green ball = $5/10 = 0.5$
- Probability of not drawing green = $1 - 0.5 = 0.5$ or 50%

3. Combined Events and Probability Trees

When dealing with two or more events, probability trees help visualize the possible outcomes and their probabilities.

Sample question: If a coin is flipped and a die is rolled, what is the probability of getting heads and a 4?

Answer:

- Probability of heads = $1/2$
- Probability of rolling a 4 = $1/6$
- Combined probability = $(1/2) \times (1/6) = 1/12 \approx 8.33\%$

Practice Questions and Solutions from Clip 90

To master the content in Mathswatch Probability Clip 90, practicing with real questions is essential. Here are some typical questions and detailed step-by-step solutions.

1. Probability of an Event in a Card Deck

Suppose a standard deck has 52 cards. What is the probability of drawing an Ace?

Answer:

- Number of Aces in deck = 4
- Total cards = 52
- Probability = $4/52 = 1/13 \approx 7.69\%$

2. Probability of Multiple Events

In a bag with 4 red and 6 yellow balls, if one ball is drawn and not replaced, what is the probability that both balls drawn are red?

Answer:

- First draw: $P(\text{red}) = 4/10 = 2/5$
- Second draw: After removing one red, remaining red balls = 3, total remaining balls = 9
- $P(\text{red on second draw}) = 3/9 = 1/3$
- Combined probability = $(4/10) \times (3/9) = (2/5) \times (1/3) = 2/15 \approx 13.33\%$

3. Using Probability Diagrams

Given a probability tree with branches representing different outcomes, how do you find the probability of a specific sequence?

Answer:

- Identify the branches corresponding to the sequence
- Multiply the probabilities along the branches
- Sum probabilities if multiple sequences lead to the same event
