Sample Questions and Model Answers from May 2011 Mark Scheme

Below are examples of typical questions from the May 2011 Chemistry paper, along with insights into how they are marked.

Question 1: Describe the process of simple distillation and explain why it is used.

Mark Scheme Highlights:

- Heating the mixture to the boiling point of the component to be separated
- Vaporization of the component
- Condensation of vapor back into liquid
- Used to separate liquids with different boiling points

Sample Answer:

Simple distillation involves heating the mixture until the component with the lower boiling point vaporizes. The vapor then passes through a condenser where it cools and turns back into liquid, which is collected separately. This method is used to separate a liquid from a mixture when the components have significantly different boiling points.

Question 2: Explain how the reactivity of alkali metals changes down the group.

Mark Scheme Highlights:

- Atomic radius increases down the group
- Outer electron is further from nucleus
- Less attraction between nucleus and outer electron
- Reactivity increases down the group

Sample Answer:

As you move down the group, alkali metals have larger atomic radii because additional electron shells are added. The outermost electron is thus further from the nucleus and experiences less electrostatic attraction. Consequently, it is easier for the atom to lose this electron, making the metal more reactive as you go down the group.
