Introducción a las Funciones y sus Representaciones

Definición de Función

Una función es una relación que asigna a cada elemento de un conjunto de entrada, llamado dominio, exactamente un elemento del conjunto de salida, llamado codominio. Matemáticamente, se denota como:

- $f: D \rightarrow R$, donde D es el dominio y R el codominio.
- Para cada $x \in D$, existe un único $f(x) \in R$.

Formas de Representar Funciones

Las funciones pueden representarse de varias maneras:

- **Forma algebraica:** por una expresión, como $f(x) = x^2 + 3x - 5$.
- **Gráficamente:** mediante sus curvas en el plano cartesiano.
- **Tablas de valores:** listando pares ordenados $(x, f(x))$.
- **Representación verbal o contextual:** describiendo la relación en un problema del mundo real.

Propiedades de las Funciones

Inyectividad, Sobreyectividad y Biyectividad

Estos conceptos son fundamentales para clasificar funciones:

- **Inyectiva (uno a uno):** Cada elemento del dominio tiene una imagen distinta en el codominio.
- **Sobreyectiva (sobre):** La imagen de la función cubre todo el codominio.
- **Biyectiva:** Es inyectiva y sobre, estableciendo una correspondencia uno a uno entre dominio y codominio.

Funciones Compuestas y Funciones Inversas

- La composición de funciones $(f(g(x)))$ combina dos funciones en una sola.
- La función inversa, $(f^{-1}(x))$, deshace la acción de $(f(x))$, siempre que (f) sea biyectiva.

Transformaciones y Análisis de Funciones

Transformaciones de Gráficas

Las funciones pueden ser modificadas mediante:

- **Traslaciones:** desplazamiento horizontal o vertical.
- **Escalados:** estiramientos o compresiones en los ejes.
- **Reflexiones:** inversión respecto a los ejes.

Estas transformaciones se analizan mediante las funciones base y sus parámetros.

Análisis de Funciones

Incluye:

- Determinar dominio y rango.
- Identificar puntos críticos y intervalos de crecimiento o decrecimiento.
- Encontrar extremos relativos y absolutos.

Límites y Continuidad

Concepto de Límite

El límite de una función en un punto (a) , denotado como $(\lim_{x \rightarrow a} f(x))$, representa el valor al que se acerca la función cuando (x) se acerca a (a) .

Propiedades de los Límites

- Límites de sumas, restas, productos y cocientes.
- Límites de funciones compuestas.
- Límites infinitos y límites en el infinito.

Continuidad de Funciones

Una función es continua en un punto a si:

- Está definida en a .
- El límite en a existe.
- El valor de la función en a coincide con el límite.

Derivadas y Su Interpretación

Definición de la Derivada

La derivada de una función en un punto a , denotada como $f'(a)$, indica la tasa de cambio instantánea en ese punto:

[

$$f'(a) = \lim_{h \rightarrow 0} \frac{f(a+h) - f(a)}{h}$$

]

Es la pendiente de la tangente a la gráfica en a .

Reglas de Derivación

Incluyen:
