Applying the power of a point theorem:

$$(\text{Outside segment 1}) \times (\text{entire secant segment}) = (\text{Outside segment 2}) \times (\text{entire secant segment})$$

$$4 \times 8 = 6 \times x$$

$$32 = 6x$$

$$x = 32 / 6 \approx 5.33$$

How to Approach the McGraw Hill Geometry Circles Quiz

Step 1: Read Each Question Carefully

Identify what is being asked?whether it?s about calculating angles, lengths, or identifying properties.

Step 2: Recall Relevant Theorems and Formulas

Match the question with the appropriate circle theorem or formula, such as:

- $\text{Arc measure} = 2 \times \text{Inscribed angle}$
- $\text{Chord length} = 2 \times \text{radius} \times \sin\left(\frac{\text{central angle}}{2}\right)$
- Power of a point formula: $\text{(external segment)} \times \text{(external segment)} = \text{(secant segment)} \times \text{(tangent segment)}$

Step 3: Visualize and Draw Diagrams

Sketching the figure helps clarify relationships and reduces errors.

Step 4: Substitute Known Values and Solve

Plug in given measurements, perform calculations carefully, and double-check units and logic.

Sample Questions and Detailed Answer Key

Question 1: Find the measure of an inscribed angle intercepting a 100° arc.

Answer Breakdown:

- Recall that an inscribed angle measures half the intercepted arc.

- Calculation: $\left(\frac{100^\circ}{2} = 50^\circ\right)$
- Answer: The inscribed angle measures 50° .

Question 2: Given a circle with a radius of 7 units, find the length of a chord subtending a 60° central angle.

Answer Breakdown:

- Use the chord length formula: $\left(\text{Chord} = 2 \times r \times \sin\left(\frac{\theta}{2}\right)\right)$
- $\left(r = 7\right)$, $\left(\theta = 60^\circ\right)$
- $\left(\text{Chord} = 2 \times 7 \times \sin(30^\circ)\right)$
- $\left(\sin(30^\circ) = 0.5\right)$
- $\left(\text{Chord} = 14 \times 0.5 = 7\right)$
- Answer: The chord length is 7 units.

Question 3: Two tangents are drawn from an external point to a circle, touching the circle at points A and B. If the lengths of the tangents from the external point are 10 units each, what is the distance between points A and B?

Answer Breakdown:

- The two tangents from the same external point are equal in length.
- The line segment between points A and B forms a chord, and the external point, the circle's center, and the chord relate via the right triangle.
- The distance between A and B can be found using the power of a point or by constructing right triangles.
- Key: The distance between A and B is the length of the chord subtended by the external point. Since both tangents are equal, and the point is outside, the distance between A and B is less than twice the tangent length.
- Using the right triangle formed with the external point, the radius, and the tangent length, the chord length formula applies:

$$\left(AB = 2 \times \sqrt{t^2 - r^2}\right)$$

where $\left(t = 10\right)$ units (tangent length), $\left(r\right)$ (radius unknown).

Since the problem lacks radius, but in typical problems, if the external point is at a distance $\left(d\right)$ from the circle's center, then:

$$\text{tangent length} = \sqrt{d^2 - r^2}$$

Without specific radius or position, the best approach is to recognize that in many cases, the answer hinges on the known tangent length and the relationships involved. If more data were provided, you'd proceed accordingly.

- Summary: For this question, students should recognize the properties of tangent segments and their relationship to the circle's radius and external point.
