Question What are the common signs and symptoms of preeclampsia during pregnancy? **Answer** Common signs include high blood pressure, proteinuria, severe headaches, visual disturbances, abdominal pain, and swelling of the hands and face. How is gestational diabetes diagnosed and managed? Gestational diabetes is diagnosed through oral glucose tolerance tests typically between 24-28 weeks of pregnancy. Management involves dietary modifications, blood sugar monitoring, and sometimes insulin therapy to maintain optimal glucose levels. What are the indications for cesarean section in obstetrics? Indications include fetal distress, abnormal fetal presentation, placental issues like placenta previa, active genital herpes infection, previous cesarean delivery with certain scar types, and failure to progress in labor. What are the common causes of postpartum hemorrhage? Common causes include uterine atony, retained placental tissue, genital tract trauma, and coagulopathies such as disseminated intravascular coagulation (DIC). How can ovarian cysts be distinguished from malignant ovarian tumors? Ultrasound features such as unilocular cysts with thin walls are usually benign, while solid components, irregular borders, papillary projections, and blood flow on Doppler may suggest malignancy. Tumor markers like CA-125 can also aid in differentiation. What are the latest recommendations for cervical cancer screening? Current guidelines recommend Pap smear screening every 3 years for women aged 21-29, and co-testing with Pap and HPV testing every 5 years for women aged 30-65. Screening is generally discontinued after age 65 if recent tests are normal. What are the key factors influencing the management of menopause? Management depends on symptoms severity, patient age, risk factors, and preferences. Hormone replacement therapy (HRT) can be used for vasomotor symptoms, osteoporosis prevention, and other menopausal symptoms, but risks and benefits must be carefully weighed.
