The Foundations of Linear Models

What Are Linear Models?

At their core, linear models describe a relationship between a dependent variable (response) and one or more independent variables (predictors) through a linear equation:

$$y = \beta_0 + \beta_1 x_1 + \beta_2 x_2 + \dots + \beta_p x_p + \epsilon$$

where:

- y is the response variable.
- $x_1, x_2, \dots, x_p$ are predictor variables.
- β_0 is the intercept.
- $\beta_1, \beta_2, \dots, \beta_p$ are coefficients representing the effect size of each predictor.
- ϵ is the error term, capturing noise and unmodeled variation.

Historical Context and Significance

The development of linear models traces back to statistical pioneers like Francis Galton, Karl Pearson, and Ronald Fisher. Their work laid the groundwork for regression analysis and analysis of variance (ANOVA), which are integral components of the linear modeling framework.
