Analyzing Sample Questions from 1988

Below, we examine representative questions from the 1988 exam, breaking down their concepts, problem-solving approaches, and common pitfalls.

Mechanics Section: Question Analysis

Question 1: Kinetic Energy and Work

Suppose a block slides down an inclined plane without friction. How does its kinetic energy at the bottom compare to the potential energy at the top?

- The kinetic energy equals the initial potential energy.
- The kinetic energy is less than the initial potential energy.
- The kinetic energy exceeds the initial potential energy.
- They are unrelated.

Explanation:

This question tests understanding of energy conservation. Since there's no friction, the mechanical energy is conserved. The potential energy at the top converts entirely into kinetic energy at the bottom, leading to:

- Kinetic energy at the bottom = initial potential energy.

Correct answer: **Option 1**

Question 2: Conservation of Momentum

A glider moving on a frictionless track collides elastically with another stationary glider. Which statement is true about their velocities after the collision?

- They exchange velocities.
- The moving glider stops, and the stationary glider moves with the initial velocity of the first.
- Both gliders move with the same velocity after collision.
- The velocities remain unchanged.

Explanation:

In elastic collisions between identical masses, they exchange velocities. This is a classic outcome derived from conservation of momentum and kinetic energy. Specifically, if masses are equal, the moving object comes to rest, while the stationary object takes on the initial velocity of the first.

- Correct answer: **Option 2**

Electricity and Magnetism Section: Question Analysis

Question 26: Coulomb's Law

Two point charges, $+q$ and $-q$, are separated by a distance r . What is the electric force between them?

- Zero
- Repulsive, proportional to $1/r^2$
- Attractive, proportional to $1/r^2$
- Attractive, proportional to r

Explanation:

According to Coulomb's Law, the magnitude of the electrostatic force between two point charges is:

- $F = k |q_1 q_2| / r^2$

Since the charges are opposite (+q and -q), the force is attractive. Therefore, the correct answer is:

- Option 3

Question 27: Electric Field and Potential

An electron is placed at a point in an electric field. How does its electric potential energy change if it moves closer to a positive charge?

- Increases
- Decreases
- Remains the same
- Depends on the electron's velocity

Explanation:

The potential energy of a negative charge (electron) in an electric field created by a positive charge decreases as it moves closer, due to the attractive nature of the force. This is consistent with the fact that the electron gains kinetic energy as it moves toward the positive charge, causing potential energy to decrease.

- Correct answer: **Option 2**

Among these, the 1988 MCQ set offers a valuable window into the exam's approach, question style, and conceptual depth. This detailed review aims to dissect the explanations of the 1988 MCQs, providing learners and educators with insights into problem-solving strategies, core concepts, and common pitfalls.

Background and Context of the 1988 AP Physics C MCQs

Historical Significance

The 1988 AP Physics C exam was part of the early years of the AP Physics C course, which was designed to mirror college-level physics. The MCQs from this year exemplify the exam's emphasis on conceptual understanding combined with mathematical reasoning. These questions often challenge students to apply fundamental principles to novel situations, emphasizing problem-solving

skills over rote memorization.

Types of Questions in 1988

The multiple-choice section typically includes:

- Conceptual questions requiring interpretation of physical phenomena.
- Quantitative problems demanding algebraic manipulation and application of formulas.
- Application questions that combine multiple concepts, such as dynamics, kinematics, and energy conservation.

The 1988 MCQs are notable for their clarity, precision, and conceptual depth, providing excellent material for analysis and explanation.

Deep Dive into the 1988 MCQs: Question-by-Question Analysis

While the actual questions vary, typical problems from 1988 involve classical mechanics and electromagnetism. Below, we explore some representative questions, their explanations, and the underlying physics principles.

Question 1: Motion of a Particle on an Inclined Plane

Sample Question:

A particle slides down a frictionless inclined plane of height h . What is its speed at the bottom of the incline?

Key Concepts:

- Conservation of energy
- Gravitational potential energy
- Kinetic energy

Explanation:

- Initial Potential Energy: $(PE = mgh)$
- Final Kinetic Energy: $(KE = \frac{1}{2}mv^2)$

Applying conservation of energy:

\[

$$mgh = \frac{1}{2}mv^2$$

\]

Cancelling mass (m) :

\[

$$gh = \frac{1}{2}v^2$$

\]

Solving for (v) :

\[

$$v = \sqrt{2gh}$$

\]

Important Notes:

- The absence of friction simplifies the problem.
- The velocity depends only on the height (h) , not on the mass.

Common Pitfall:

- Confusing potential energy at the top with kinetic energy at the bottom.
- Forgetting to square root the expression.

Question 2: Tension in a Rotating System

Sample Question:

A mass (m) attached to a string rotates in a horizontal circle of radius (r) at a constant angular

speed v . What is the tension T in the string?

Key Concepts:

- Centripetal force requirement
- Tension as the source of centripetal force

Explanation:

The tension provides the centripetal force:

[

$$T = m r \omega^2$$

]

Alternatively, if the linear speed v is given ($v = r \omega$), the tension can also be expressed as:

[

$$T = \frac{m v^2}{r}$$

]

Important Notes:

- The tension must balance the inward centripetal force.
- If the problem involves additional forces (like gravity in vertical circles), the analysis becomes more complex.

Common Pitfall:

- Assuming tension equals weight when in vertical circles.
- Neglecting the directionality of forces.

Question 3: Electric Field and Coulomb's Law

Sample Question:

Two point charges (q_1) and (q_2) are separated by a distance (r) . What is the electric force exerted on (q_1) by (q_2) ?

Key Concepts:

- Coulomb's Law
- Vector nature of electric forces

Explanation:

Coulomb's Law states:

[

$$F = k \frac{|q_1 q_2|}{r^2}$$

]

where $(k \approx 8.99 \times 10^9, \mathrm{Nm}^2/\mathrm{C}^2)$.

The force acts along the line connecting the charges, attracting or repelling depending on the signs of (q_1) and (q_2) .

Important Notes:

- The force is vectorial; direction depends on charge signs.
- The magnitude calculation is straightforward, but understanding vector direction is crucial.

Common Pitfall:

- Confusing magnitude with vector direction.
- Ignoring sign conventions.
