Physics Principles Explored in the Project

Projectile Motion and Parabolic Trajectories

At the heart of the project is the physics of projectile motion, which describes the path of an object thrown into the air, influenced solely by gravity and initial launch conditions.

Key equations include:

- Horizontal motion: $x = v_0 \cos \theta \times t$
- Vertical motion: $y = v_0 \sin \theta \times t - \frac{1}{2} g t^2$
- Range: $R = \frac{v_0^2 \sin 2\theta}{g}$
- Maximum height: $H = \frac{v_0^2 \sin^2 \theta}{2g}$

Where:

- v_0 = initial velocity
- θ = launch angle
- g = acceleration due to gravity ($\sim 9.81 \text{ m/s}^2$)
- t = time of flight

Understanding these equations and how they relate to observed trajectories forms the core learning objective.

Impact of Launch Parameters

The project explores:

- Launch angle (θ): How changing the angle affects the height and distance.
- Initial velocity (v_0): How tension in the launcher influences the projectile's speed.
- Height of launch point: How launching from different heights alters the trajectory.
- Air resistance: While often neglected in basic physics, some advanced versions of the project introduce drag effects for more realistic modeling.

Participants learn to manipulate these variables and observe their effects, solidifying the concept of how parabolas are shaped by initial conditions.
