The Human Heart: An Overview

The human heart is a muscular organ roughly the size of a clenched fist, situated slightly left of the center of the chest. Its primary function is to pump blood throughout the body, delivering oxygen and nutrients to tissues while removing waste products. This continuous cycle sustains life and supports every physical process, from breathing to complex cognitive functions.

Anatomy of My Heart

Understanding my heart begins with its anatomy. The heart comprises several key structures that work in harmony:

- Chambers of the Heart

- Atria (Upper Chambers): The right and left atria receive blood returning to the heart.
- Ventricles (Lower Chambers): The right and left ventricles pump blood out of the heart to the lungs and body, respectively.

- Valves

Valves ensure unidirectional blood flow and prevent backflow:

- Tricuspid Valve: Between right atrium and right ventricle.
- Pulmonary Valve: Between right ventricle and pulmonary artery.
- Mitral Valve: Between left atrium and left ventricle.
- Aortic Valve: Between left ventricle and aorta.

- Blood Vessels

- Coronary Arteries: Supply blood to the heart muscle itself.
- Aorta: The main artery carrying oxygen-rich blood to the body.
- Pulmonary Arteries and Veins: Carry blood to and from the lungs.

- Conduction System

The heart has an intrinsic electrical system that controls heartbeat:

- Sinoatrial (SA) Node: The natural pacemaker.
- Atrioventricular (AV) Node: Relays electrical signals.
