Sample Practice Problem with Answer Breakdown

Problem: A particle is pulled along an inclined plane by a force of 100 N acting at an angle of 30° to the horizontal. The incline makes an angle of 45° with the horizontal. Find the component of the pulling force acting parallel to the incline.

Solution Steps:

- Draw a Diagram

- Inclined plane at 45° .
- Force of 100 N at 30° to the horizontal.
- Goal: component of this force along the incline.

- Resolve the Force into Components

- Since the force is at 30° to the horizontal, we need its component along the direction of the incline.

- Find the Force Component Along the Incline

- The component of the force parallel to the incline is:

$\backslash$

$$F_{\text{parallel}} = F \cos(\theta - \alpha)$$

$\backslash$

where:

- $(F = 100\text{ N})$

- $\theta = 30^\circ$ (force angle)
- $\alpha = 45^\circ$ (incline angle)

- The angle between the force and the incline is:

[

$$\theta - \alpha = 30^\circ - 45^\circ = -15^\circ$$

]

- Since cosine is an even function, $\cos(-15^\circ) = \cos(15^\circ)$, so:

[

$$F_{\text{parallel}} = 100 \times \cos(15^\circ) \approx 100 \times 0.9659 \approx 96.59, \text{ N}$$

]

- Answer:

- The component of the pulling force acting parallel to the incline is approximately 96.6 N.

Interpreting and Using Practice Problem Answers Effectively
