Problem 1: Velocity of a Point in a Slider-Crank Mechanism

Given a slider-crank mechanism where the crank (AB) rotates at 300 rpm, with length $(AB = 0.15\text{ m})$, and the connecting rod (BC) has length (0.5 m) . Find the velocity of the slider (C) when the crank makes a 60° angle with the horizontal.

Solution:

- **Identify knowns:** $\omega_{AB} = 300\text{ rpm} = \frac{300 \times 2\pi}{60} \approx 31.42\text{ rad/sec}$; $\theta = 60^\circ$; $(AB = 0.15\text{ m})$; $(BC = 0.5\text{ m})$.
- **Convert rpm to rad/sec:** $\omega_{AB} = 31.42\text{ rad/sec}$.
- **Determine the velocity of point B:** $\vec{v}_B = \vec{\omega}_{AB} \times \vec{r}_{AB}$.
-

Calculate $\vec{v}_B$:

\[

$$v_B = \omega_{AB} \times AB = 31.42 \text{ rad/sec} \times 0.15 \text{ m} \approx 4.71 \text{ m/sec}$$

\]

Direction: perpendicular to (AB) , following the right-hand rule.

- **Use relative velocity equation:** $(v_C = v_B + v_{C/B})$, but since (C) is on the connecting rod (BC) , and assuming the mechanism is planar and rigid, apply the velocity polygon or complex vector method to find (v_C) .

-

Apply geometric approach:

- Construct the velocity triangle at point B, considering the known velocity magnitude and direction.

- Use the law of sines or cosines to resolve the components.

- **Result:** The slider (C) moves with a velocity approximately (4.71 m/sec) in the horizontal direction when the crank is at 60° .

Problem 2: Accelerations in a Four-Bar Linkage

In a four-bar linkage, the crank (AB) rotates at 150 rpm counterclockwise, with length $(AB = 0.2 \text{ m})$. The coupler (BC) has length (0.5 m) , and the fixed link (AD) is 0.4 m. Find the acceleration of the coupler point (C) when $(\angle ABC = 45^\circ)$.

Solution:

- **Convert rotational speed:** $(\omega_{AB} = \frac{150 \times 2\pi}{60} = 15.7 \text{ rad/sec})$.

- **Determine the velocity of (B) :**

\[

$$v_B = \omega_{AB} \times AB = 15.7 \times 0.2 = 3.14 \text{ m/sec}$$

\]

- **Apply velocity analysis:**

- Use the velocity polygon to find the direction of (v_B) .
- Resolve to find velocity components of point (C) .
- Use geometric relations to find the velocity of (C) .
- **Calculate acceleration:**
 - Determine the angular acceleration (α_{AB}) if necessary (assumed zero if steady speed).
 - Use the acceleration equation:

$$[$$

$$\vec{a}_C = \vec{\alpha}_{AB} \times \vec{r}_{AC} + \vec{\omega}_{AB} \times (\vec{\omega}_{AB} \times \vec{r}_{AC}) + \text{relative acceleration terms}$$

$$]$$

- Since (α_{AB}) is not given, assume zero for simplicity, then:

$$[$$

$$a_C = \omega_{AB}^2 \times r_{AC}$$

$$]$$

- **Final result:**

$$[$$

$$a_C = (15.7)^2 \times 0.5 \approx 123.45 \text{ m/sec}^2$$

$$]$$

- Rotational motion: Movement about an axis
- Combined motion: A combination of translation and rotation, such as in linkages or gears

- Kinematic Equations

Fundamental equations used include:

- $v = v_0 + a t$ (velocity-time relation)

- $(s = s_0 + v_0 t + \frac{1}{2} a t^2)$ (displacement-time relation)
- For rotational motion: $(\omega = \omega_0 + \alpha t)$, $(\theta = \theta_0 + \omega_0 t + \frac{1}{2} \alpha t^2)$

- Relative Velocity and Acceleration

Understanding how different parts of a mechanism move relative to each other is critical. The key principles include:

Typical Merriam Kinematics Problems with Solutions

Problem 1: Slider-Crank Mechanism ? Calculating the Velocity of the Slider

Problem Statement:

A slider-crank mechanism consists of a crank rotating at 300 rpm with a length of 0.2 m. The connecting rod length is 0.5 m. Determine the velocity of the slider when the crank makes a 60° angle with the horizontal.

Solution Approach:

- Identify Known Data:
- $(\omega_{\text{crank}} = 300 \text{ rpm} = \frac{300 \times 2\pi}{60} = 10\pi \text{ rad/sec})$
- Crank length $(r = 0.2 \text{ m})$
- Connecting rod length $(L = 0.5 \text{ m})$
- Crank angle $(\theta = 60^\circ)$

- Convert ω to rad/sec:

$$\omega = 10\pi \approx 31.416 \text{ rad/sec}$$

- Determine the velocity of the crank's end:

$$v_{\text{crank}} = r \omega \sin \theta$$

$$v_{\text{crank}} = 0.2 \times 31.416 \times \sin 60^\circ$$

$$v_{\text{crank}} = 0.2 \times 31.416 \times 0.866 \approx 5.44 \text{ m/sec}$$

- Apply the velocity relation for the slider:

Using the loop-closure equation and relative motion analysis, the slider velocity v_s can be calculated via the velocity triangle or using the velocity method:

[

$$v_s = v_{\text{crank}} \cos \theta + \text{additional components}$$

]

But more straightforwardly, the velocity of the slider (assuming a proper configuration) is:

[

$$v_s = r \omega \cos \theta$$

]

$$v_s = 0.2 \times 31.416 \times \cos 60^\circ = 0.2 \times 31.416 \times 0.5 \approx 3.14 \text{ m/sec}$$

Final Answer:

The velocity of the slider at the given instant is approximately 3.14 m/sec.

Problem 2: Determining Angular Acceleration in a Linkage

Problem Statement:

A four-bar linkage operates with a fixed link of 0.4 m rotating at 120 rpm. The coupler link of length 0.3 m makes a 45° angle at a certain instant. Find the angular acceleration of the coupler if the crank's angular acceleration is 50 rad/sec^2 .

Solution Approach:

- Convert known data:

- $\omega_{\text{fixed}} = 120 \text{ rpm} = 4\pi \text{ rad/sec}$
- $\alpha_{\text{crank}} = 50 \text{ rad/sec}^2$
- Link lengths: $r = 0.4 \text{ m}$, $l = 0.3 \text{ m}$
- Angle $\theta = 45^\circ$

- Apply the velocity and acceleration loop equations:

The linkage's velocity analysis yields the angular velocity of the coupler. Subsequently, the acceleration analysis involves differentiating the velocity equations to find angular acceleration.

- Velocity analysis:

Use the loop equation:

$$r \omega_{\text{crank}} + l \omega_{\text{coupler}} = \text{constant}$$

$$r \omega_{\text{crank}} + l \omega_{\text{coupler}} = \text{constant}$$

$$r \omega_{\text{crank}} + l \omega_{\text{coupler}} = \text{constant}$$

Solve for ω_{coupler} .

- Acceleration analysis:

Using the acceleration loop:

$$\lceil$$

$$r \alpha_{\text{crank}} + l \alpha_{\text{coupler}} = -r \omega_{\text{crank}}^2 \sin \theta - l \omega_{\text{coupler}}^2 \sin \phi$$

$$\rfloor$$

Where ϕ is the angle of the coupler link.

- Calculate α_{coupler} :

Substitute known values and solve for the angular acceleration.

Final Result:

This calculation involves detailed vector analysis, but after solving, the angular acceleration of the coupler is approximately $X \text{ rad/sec}^2$ (exact value depends on the precise angles and solving the equations).
