The Innate and Adaptive Immune Responses

A central theme in immunology is the distinction and interplay between innate and adaptive immunity.

Innate Immunity

- The first line of defense
- Rapid response mechanisms
- Recognizes common pathogen-associated molecular patterns (PAMPs)
- Components include physical barriers, phagocytes, natural killer cells, and soluble factors

Kuby Immunology describes how innate immunity provides immediate but non-specific defense, laying the groundwork for subsequent adaptive responses.

Adaptive Immunity

- Develops more slowly but provides specificity
- Involves lymphocytes and antibody production
- Capable of immunological memory
- Divided into humoral (antibody-mediated) and cellular (T cell-mediated) immunity

The textbook details the processes of lymphocyte activation, clonal expansion, and differentiation, emphasizing the importance of antigen recognition and receptor diversity.

Lymphocyte Development and Activation

Understanding how lymphocytes develop, mature, and become activated is essential to grasping immune responses.

B Cell Development

- Originates in the bone marrow
- Undergoes V(D)J recombination to generate receptor diversity
- Matures in secondary lymphoid organs
- Responsible for antibody production

T Cell Development

- Originates in the bone marrow but matures in the thymus
- Differentiates into helper T cells (Th), cytotoxic T cells (Tc), and regulatory T cells (Treg)
