Sample Lehninger MCQs with Detailed Answers and Explanations

To illustrate the application of these strategies, let's examine some representative MCQs inspired by Lehninger's content.

Question 1: Which amino acid has a sulfur atom in its side chain?

- A) Serine
- B) Threonine
- C) Methionine
- D) Valine

Answer: C) Methionine

Explanation: Methionine contains a sulfur atom in its side chain, making it unique among the standard amino acids in this regard. Serine and threonine have hydroxyl groups, while valine is a branched-chain amino acid without sulfur. Recognizing this structural feature is essential for understanding amino acid properties and their roles in proteins.

Question 2: In the process of glycolysis, which enzyme catalyzes the conversion of glucose to glucose-6-phosphate?

- A) Hexokinase
- B) Phosphofructokinase
- C) Pyruvate kinase
- D) Aldolase

Answer: A) Hexokinase

Explanation: Hexokinase catalyzes the phosphorylation of glucose to produce glucose-6-phosphate, the first step in glycolysis. Phosphofructokinase acts later in the pathway, while pyruvate kinase catalyzes the final step. Aldolase is involved in splitting fructose-1,6-bisphosphate. Recognizing enzyme functions within pathways is crucial for understanding metabolic regulation.

Question 3: Which of the following statements about ATP is correct?

- A) It is a high-energy phosphate compound primarily used in anabolic reactions.
- B) Its hydrolysis releases energy that can be used to drive endergonic processes.
- C) It is synthesized exclusively via substrate-level phosphorylation.
- D) It is stored in cells primarily as phosphocreatine.

Answer: B) Its hydrolysis releases energy that can be used to drive endergonic processes.

Explanation: ATP hydrolysis releases free energy used to power various cellular activities, including muscle contraction, active transport, and biosynthesis. While ATP is involved in biosynthesis (anabolism), it is also used in energy-requiring processes. It is synthesized both via substrate-level phosphorylation and oxidative phosphorylation. Phosphocreatine serves as a rapid energy buffer but is not the main storage form of ATP.
