What Is a Lennox Compressor Start Relay?

The compressor start relay is an electrical device that acts as a switch, controlling the power supplied to the compressor. In Lennox HVAC systems, as with most modern units, this component plays a pivotal role in starting the compressor motor reliably and efficiently.

Definition and Basic Function

The Lennox compressor start relay is an electromagnetic switch that momentarily connects the compressor to the power supply during startup. Its primary function is to supply the initial surge of current needed to start the motor, which typically requires more power than running it continuously. Once the compressor reaches a certain speed, the relay disengages, allowing the system to operate normally on the run capacitor and other components.

How It Fits into the System

The compressor start relay works in conjunction with the capacitor, hard start kit, and overload protector. When the thermostat calls for cooling or heating, the control board energizes the start relay, which then allows the compressor to begin its startup process. After a few seconds, the relay opens, and the compressor continues to run smoothly.

Components of a Lennox Compressor Start System

Understanding the parts involved helps clarify how the start relay functions and how issues may arise.

Key Components

- **Start Relay:** The electromagnetic switch that completes the circuit to supply power during startup.
- **Start Capacitor:** Provides an extra boost of energy during initial startup to help the motor overcome inertia.
- **Run Capacitor:** Maintains steady operation once the compressor is running.
- **Overload Protector:** Protects the compressor from overheating or electrical overloads.
- **Compressor Motor:** Converts electrical energy into mechanical motion to compress refrigerant.

Each component has a specific role, but the start relay's function as a switch is fundamental to ensuring smooth and reliable compressor startups.

How Does a Lennox Compressor Start Relay Work?

The operation of the start relay is straightforward but vital for system efficiency.

Step-by-Step Operation

- **System Call for Cooling/Heating:** The thermostat signals the HVAC system to turn on.
- **Control Board Activation:** The control board sends a voltage signal to the start relay.
- **Energizing the Relay:** The electromagnetic coil inside the relay energizes, causing the switch to close.
- **Power to the Compressor:** The closed switch allows current to flow from the capacitor to the compressor motor's start winding.
- **Motor Starts:** The compressor motor receives a surge of power, overcoming inertia and starting to rotate.
- **Relay Opens:** After a predetermined time (usually a few seconds), the relay opens, disconnecting the start winding.
- **Normal Operation:** The compressor runs on the run capacitor without the start winding.

Critical Timing and Control

The timing of relay operation is crucial; if it opens too early or too late, it can cause system faults or damage. Many Lennox units incorporate hard start kits or smart relays that improve reliability and performance.
