Sample SGIM Practice Questions and Explanations

Question 1: Clinical Scenario

A 55-year-old man presents with fatigue, weight loss, and night sweats. His labs show anemia, elevated ESR, and positive rheumatoid factor. What is the most likely diagnosis?

- A) Rheumatoid arthritis
- B) Tuberculosis
- C) Lymphoma
- D) Sarcoidosis

Answer and Explanation:

Correct Answer: C) Lymphoma

This patient's constitutional symptoms (weight loss, night sweats), anemia, elevated ESR, and positive RF suggest a systemic process. While rheumatoid arthritis can cause positive RF, the presence of systemic B symptoms and anemia point toward lymphoma. Confirmatory diagnosis would involve biopsy and imaging.

Question 2: Data Interpretation

A 45-year-old woman with a history of hypertension presents with chest pain. Her ECG shows ST

elevations in leads II, III, and aVF. Which coronary artery is most likely involved?

- A) Left anterior descending artery
- B) Right coronary artery
- C) Circumflex artery
- D) Left main artery

Answer and Explanation:

Correct Answer: B) Right coronary artery

ST elevations in leads II, III, and aVF indicate an inferior wall myocardial infarction, typically supplied by the right coronary artery.
