Sample Question Analysis and Model Answers

To illustrate the depth and style of questions in the 2013 F214 paper, let's analyze a typical question and its ideal approach.

Sample Question:

"A student investigates the effect of temperature on enzyme activity by measuring the breakdown of starch by amylase at different temperatures. The student records the time taken for the solution to turn clear at each temperature. Explain how temperature affects enzyme activity and interpret the

following results: at 20°C, the reaction takes 5 minutes; at 40°C, it takes 2 minutes; at 60°C, it takes 10 minutes."

Model Answer:

Temperature influences enzyme activity primarily through its effect on molecular kinetics and enzyme structure. As temperature increases from 20°C to 40°C, enzyme molecules gain kinetic energy, leading to more frequent collisions with substrate molecules, thus increasing the rate of reaction. This explains why the time to break down starch decreases from 5 to 2 minutes at higher temperature.

However, beyond the enzyme's optimal temperature (around 40°C), the enzyme's structure begins to denature due to heat. At 60°C, the enzyme's tertiary structure is compromised, leading to a significant loss of activity, which is evidenced by the increased reaction time of 10 minutes. The initial increase in activity followed by a decline highlights the importance of enzyme stability and the concept of an optimal temperature.
