Probability Theory in Devore

Fundamental Concepts of Probability

Probability forms the backbone of statistical inference. Devore introduces probability as a measure of the likelihood of an event, defined mathematically as a number between 0 and 1.

Basic probability rules include:

- The probability of an event A, denoted $P(A)$
- Complement rule: $P(A^c) = 1 - P(A)$
- Addition rule: For mutually exclusive events, $P(A \cup B) = P(A) + P(B)$
- Multiplication rule: For independent events, $P(A \cap B) = P(A) \times P(B)$

Types of probability models discussed:

- Classical probability
- Empirical probability
- Subjective probability

Conditional Probability and Independence

Devore emphasizes the importance of understanding how probabilities change given new information.

Key concepts:

- Conditional probability: $P(A|B) = P(A \cap B) / P(B)$
- Independence of events: A and B are independent if $P(A \cap B) = P(A) \times P(B)$

Bayes? Theorem

A critical tool in updating probabilities based on new data, Bayes? theorem is presented with applications in diagnostic testing, decision-making, and machine learning.

Mathematical form:

$$P(A|B) = [P(B|A) \times P(A)] / P(B)$$
